

# Sustainability Commitment

PURE+FREEFORM

## Designing Better Buildings

Whether interior or exterior, materials should be sustainable from initial design to construction to the end of their life cycle. Our core product line is aluminum, a natural, durable, and 100% recyclable material.

We fully recognize that making buildings more efficient and habitable is critical to our contribution to the built environment and ultimately, our legacy as a material designer. Our commitment to ecological awareness means we use only the highest-grade alloys and time-tested industry leading resins. Our aluminum, pigments, inks, and resins have all been tested and certified to help projects qualify for GREEN building status.

### Recyclable Metal

All of our finishes are printed onto 100% aluminum substrate, containing a minimum of 20% post-consumer recycled content in all of our metal wall and ceiling panels. Because we use single-skin aluminum, our products are all 100% recyclable.

### VOC and Red List Free

Materials should make buildings better. Our products are free from VOCs (Volatile Organic Compounds), ensuring indoor and outdoor air quality. We're also committed to being Red List free, a standard set to remove the worst in class materials that directly impact pollution levels, the food chain, and construction and factory workers.

## Industry Standards

Our commitment to sustainability is not only to reduce cost and enhance building marketability, but to reduce negative impacts on our environment and those who inhabit it. We are committed to manufacturing eco-friendly materials that will last for years to come. By working directly with building owners, design teams, and subcontractors, we are ensuring our materials meet the most recent standards of the market, such as LEED, HPD, and our products participate in the mindfulMATERIALS library.
